Lab_4_VibeCoding_Stude...
PDF

SETAPESU26/44_simple-platformer , this is the repo link and pdf what to do can u tell me what to step by step

Worked for 7s

Yes. I checked the Lab 4 handout. The assignment is essentially:

Take the assigned broken game → run it → record it before changes → use Vibe Coding prompts to fix/add features → record after → push your completed work to your own repo → submit everything inside `Lab-4` **.** Lab_4_VibeCoding_Student_handout

I couldn't directly fetch the GitHub repository from here, so I **don't want to invent what features are in its README**. The handout specifically says the README contains the deliverables/features you must implement. Lab_4_VibeCoding_Student_handout

What you need to do — step by step

STEP 1 — Open your assigned repository

Open:

44_simple-platformer GitHub repository ↗

You should see something like:

```
44_simple-platformer
├── README.md
├── ...
├── Python files
└── ...
```

First thing: open `README.md` .

Do **not** start changing code yet.

STEP 2 — Read the README

Look for two things:

A. What is currently broken?

For example, it might say things like:

```
Bug:
- Player cannot jump
- Collision doesn't work
- Game crashes
```

B. What features must be added?

For example:

```
Features:
1. Add enemies
2. Add score
3. Add game-over screen
4. Add sound
```

These README requirements are what you have to implement.

The handout explicitly says:

> "Write prompts to add all the features listed in the ReadMe file of the repo one by one." Lab_4_VibeCoding_Student_handout

So don't randomly add features.

STEP 3 — Fork the repository

Since the instruction says you need to work in **your personal account**, fork the repository.

On GitHub:

Fork → Create fork

Your copy should become something like:

```
Bhavana666coder/44_simple-platformer
```

instead of:

```
SETAPESU26/44_simple-platformer
```

The handout says to clone or fork the assigned repo and push the changes to your personal account. Lab_4_VibeCoding_Student_handout

---

STEP 4 — Clone YOUR fork

After forking, click:

Code → HTTPS → Copy

Then in your terminal:

Bash

```
git clone YOUR_FORK_URL
```

For example:

Bash

```
git clone https://github.com/Bhavana666coder/44_simple-platformer.git
```

Then:

Bash

```
cd 44_simple-platformer
```

Check:

Bash

```
ls
```

You should see the project files.

STEP 5 — Install requirements

Look for:

```
requirements.txt
```

If it exists:

```bash
pip install -r requirements.txt
```

If there is no `requirements.txt`, check the README for installation instructions.

Since this is a Python game, it may use something such as Pygame, but **don't install random libraries until you see what the project actually requires.**

STEP 6 — RUN THE ORIGINAL GAME

This is VERY important.

Before modifying anything, get the original game running.

The handout specifically requires:

> "Run the Python based code (A game/ A Puzzle)" Lab_4_VibeCoding_Student_handout

Look for the main Python file.

It could be something like:

```
main.py
game.py
platformer.py
```

Then run:

```bash
python main.py
```

or whatever file the README specifies.

STEP 7 — Record the BEFORE video

Do this before fixing anything.

The handout requires:

"Record 10 seconds of video before making any changes." Lab_4_VibeCoding_Student_handout

So record approximately **10 seconds** showing the original/broken game.

For example:

```
00:00 → Start game
00:03 → Show player
00:06 → Demonstrate broken behavior
00:10 → Stop recording
```

Name it something obvious:

```
before.mp4
```

Don't modify the code before this recording.

STEP 8 — Start using Vibe Coding

This is the main purpose of the lab.

You need to use ChatGPT/Gemini/Claude/etc. to fix the code through prompts.

The handout says the goal is to learn how to get the job done in **3–4 attempts**.

Lab_4_VibeCoding_Student_handout

Don't give 20 tiny prompts.

Instead, give a good prompt containing:

1. What the project is
2. What is broken
3. What you want fixed
4. Constraints
5. Ask it to inspect the existing code rather than rewriting everything

For example:

```
I have a Python simple platformer game.

Please inspect the existing code and identify why the player
collision/jump behavior is not working correctly.

Do not rewrite the entire project.
Keep the existing structure and graphics.
Make the smallest necessary changes to fix the issue.
```

```
Explain:
1. What was wrong
2. Which files you changed
3. What you changed
4. How I can test the fix
```

Then apply the changes.

STEP 9 — Test the fix

Run the game again.

Check:

```
Does it start?
       ↓
Does the player move?
       ↓
Does jumping work?
       ↓
Does collision work?
       ↓
Does the game behave normally?
```

If something is still broken, give the next prompt.

For example:

```
I applied your previous fix, but the player still falls
through the platform.

Here is the current error/behavior:

[paste error or explain behavior]

Please inspect the existing collision logic and fix only
the relevant issue. Do not rewrite unrelated parts.
```

This is much better than:

"FIX IT"

😂

STEP 10 — Add the README features ONE BY ONE

This is important.

Suppose the README says:

```
Required features:
1. Player health
2. Enemies
3. Score
4. Game-over screen
```

Do:

Prompt 1

```
Now implement feature 1 from the README: player health.

Please modify the existing project rather than creating
a separate implementation.

Keep all existing functionality working.

After making the change, explain what files were modified
and how I can test the feature.
```

Test it.

Then:

Prompt 2

```
Now implement feature 2 from the README: enemies.

Build on the existing code.

Do not remove or break the player health functionality.

Explain the changes and how to test them.
```

Test.

Then feature 3.

Then feature 4.

This matches the assignment requirement to add the README features **one by one**.

Lab_4_VibeCoding_Student_handout

STEP 11 — Keep your ChatGPT conversation

This is also part of your submission.

The deliverables require:

> "Chat history exported as a doc/pdf" Lab_4_VibeCoding_Student_handout

So **don't delete your conversation**.

Your conversation should show things like:

```
Prompt 1
↓
AI response
↓
Code change
↓
Testing
↓
Prompt 2
↓
AI response
↓
Code change
↓
Testing
...
```

At the end, export/save the chat as PDF.

Name it:

```
vibe_coding_chat_history.pdf
```

STEP 12 — Record the AFTER video

Once **everything in README is completed**, run the game one final time.

Record another ~10-second video.

The handout specifically requires the second recording **after all changes have been made**.

Lab_4_VibeCoding_Student_handout

Name it:

```
after.mp4
```

Try to show the new functionality in those 10 seconds.

STEP 13 — Create the Lab-4 folder

Inside your repository, create:

```
Lab-4/
```

Your final structure should look approximately like:

```
44_simple-platformer/
│
├── README.md
├── main.py
├── other_game_files...
│
└── Lab-4/
    ├── before.mp4
    ├── after.mp4
    └── vibe_coding_chat_history.pdf
```

The handout says the Lab repo should contain, under the **Lab-4 folder**:

```
a. Videos (before and after)
b. Updated Code
c. Chat history exported as doc/pdf
```

Lab_4_VibeCoding_Student_handout

Important: "Updated Code" means your modified project itself needs to be in the repo. Don't only submit screenshots of code.

STEP 14 — Git add

From your project directory:

‹/› **Bash**

```
git status
```

Then:

```bash
git add .
```

Then:

```bash
git status
```

Check that the correct files are being added.

STEP 15 — Commit

```bash
git commit -m "Complete Lab 4 Vibe Coding"
```

STEP 16 — Push

```bash
git push origin main
```

If your branch is called `master`, use:

```bash
git push origin master
```

STEP 17 — Check GitHub

Open **your fork**.

Make sure everything is actually there.

You should have:

```
YOUR_USERNAME
     │
     └── 44_simple-platformer
             │
             ├── game code
             │
             └── Lab-4
                  ├── before.mp4
                  ├── after.mp4
                  └── chat history.pdf
```

⚠️ One VERY important thing

Do NOT create a Pull Request to `SETAPESU26` **.**

The handout explicitly says:

> "Do not raise PR to the main repo (SETAPESU26)" Lab_4_VibeCoding_Student_handout

You only need to push your work to **your own repository/fork**.

Your complete checklist

You can literally tick these off:

```
☐ Open assigned repo
☐ Read README
☐ Identify broken functionality
☐ Identify ALL required features
☐ Fork repository
☐ Clone my fork
☐ Install requirements
☐ Run original game
☐ Record 10-second BEFORE video

☐ Prompt AI to fix broken code
☐ Test the fix
☐ Fix remaining problems
☐ Implement README Feature 1
☐ Test Feature 1
☐ Implement README Feature 2
☐ Test Feature 2
☐ Implement README Feature 3
☐ Test Feature 3
☐ ...continue for ALL README features
```

```
☐ Record 10-second AFTER video
☐ Export ChatGPT/Vibe Coding chat as PDF
☐ Create Lab-4 folder
☐ Put videos + chat history in Lab-4
☐ Make sure updated code is in repo
☐ git add .
☐ git commit
☐ git push
☐ Verify GitHub
☐ DON'T make PR to SETAPESU26
```

One thing I need from you next

Open the GitHub repo → open `README.md` → either upload/screenshot the README here or paste its contents.

Then I can tell you **exactly what this particular `44_simple-platformer` requires**, including:

- what is broken
- every feature you need to add
- the **exact prompts** to give ChatGPT
- what commands to run
- what to test after each prompt
- what your final `Lab-4` folder should contain

That way we won't guess what the repository's README asks you to implement.

Sources

README (1).md
File

this is my readme file

Perfect! 🎉 **Lab 4 is essentially complete.**

Final checklist

Requirement	Status
Clone/fork assigned repo	✅
Run original game	✅
Record 10-sec **BEFORE** video	✅
Fix platform collision	✅
Add Game Over screen	✅
Add Easy/Medium/Hard replay	✅
Add jump/goal/death sounds	✅
Test completed game	✅
Commit changes	✅
Push to personal GitHub	✅
Record 10-sec **AFTER** video	✅
Chat/LLM history PDF/doc	⏳

The handout requires the before/after videos, updated code, and exported chat history under the Lab-4 deliverables. Lab_4_VibeCoding_Student_handout

One thing left: Chat history

You need to save this ChatGPT conversation as a **PDF**.

Since you're using ChatGPT in your browser:

1. Stay on this conversation.
2. Press `Ctrl + P`.
3. In the printer/destination, choose **Save as PDF**.
4. Save it as:
